

IN THE CLAIMS:

1. (Currently Amended) A method for sharing execution capacity among tasks executing in a real-time computing system having a performance specification in accordance with Rate Monotonic Analysis (RMA), comprising the steps of:

*B1*  
pairing a higher priority task with a lower priority task;  
reallocating execution time from the lower priority task to the higher priority task during an overload condition; and

increasing the period of the lower priority task to compensate for said reallocated execution time; and

limiting an amount of execution time,  $N_r$ , to borrow from said lower priority task,  $task_r$ , to a maximum loan amount where  $N_r < C_r$ , where

$C_r$  = worst-case task execution time of  $task_r$ , and

$N_r$  = amount of execution time to borrow from  $task_r$ .

2. (Previously Presented) The method of claim 1, wherein an amount of said execution time available to loan from said lower priority task (hereinafter  $task_r$ ) to said higher priority task (hereinafter  $task_u$ , ) is obtained as follows:

*70/50*  
$$Nu = \frac{Nr \cdot Tu}{Tr}$$

where,

$N_r$  = amount of execution time to borrow from  $task_r$ , where  $N_r < C_r$ ,

$T_r$  = period of  $task_r$ ,

$C_r$  = worst-case task execution time of task<sub>r</sub>, and  
 $T_U$  = period of task<sub>U</sub>.

3. (Original) The method of claim 1, wherein said increased period of the lower priority task, task<sub>r</sub>, is obtained as follows:

$$Tn = \frac{Cr \cdot Tr}{Cr - Nr}$$

~~160~~  
~~B1~~ where

$C_r$  = worst-case task execution time of task<sub>r</sub>,  
 $T_r$  = period of task<sub>r</sub>, and  
 $N_r$  = amount of execution time to borrow from task<sub>r</sub>, where  $N_r < C_r$ .

4. (Cancelled)

5. (Currently Amended) The method of claim 1[[4]], wherein a maximum execution time,  $Nm$ , that may be borrowed from said lower priority task, task<sub>r</sub>, is obtained as follows:

$$Nm = Cr \left( 1 - \frac{1}{m} \right)$$

~~161~~ where m is the multiple of the period of said lower priority task, task<sub>r</sub>.

6. (Original) The method of claim 1, wherein said higher priority task has hard deadlines.

7. (Original) The method of claim 1, wherein said lower priority task has soft deadlines.

7  
8. (Currently Amended) A method for allocating resources among tasks executing in a real-time computing system having a performance specification in accordance with Rate Monotonic Analysis (RMA), comprising the steps of:

pairing a higher priority task with a lower priority task;

providing a first resource allocation to said lower priority task during a normal operating condition; and

B1  
 reallocating a portion of said first resource allocation from said lower priority task to said higher priority task when said higher priority task is operable; and  
limiting an amount of execution time,  $N_r$ , to reallocate from said lower priority task,  $task_r$ , to a maximum loan amount where  $N_r < C_r$ , where

$C_r$  = worst-case task execution time of  $task_r$ , and

$N_r$  = amount of execution time to borrow from  $task_r$ .

8  
9. (Previously Presented) The method of claim 8, wherein said reallocated portion of said first resource allocation is obtained as follows:

T0/70  

$$Nu = \frac{Nr \cdot Tu}{Tr}$$

where,

$N_r$  = amount of execution time to borrow from  $task_r$ , where  $N_r < C_r$ ,

$T_r$  = period of the lower priority task (  $task_r$  ),

$C_r$  = worst-case task execution time of  $task_r$ , and

$T_u$  = period of the higher priority task (  $task_u$  ).

9  
10. (Original) The method of claim 8, further comprising the step of increasing a

period of said lower priority task, task<sub>r</sub>, as follows:

70180

$$Tn = \frac{Cr \cdot Tr}{Cr - Nr}$$

where

C<sub>r</sub> = worst-case task execution time of task<sub>r</sub>,

T<sub>r</sub> = period of task<sub>r</sub>, and

N<sub>r</sub> = amount of execution time to borrow from task<sub>r</sub>, where N<sub>r</sub> < C<sub>r</sub>.

✓11.

(Cancelled)

11

12.

(Currently Amended) The method of claim 8, wherein a maximum execution time, N<sub>m</sub>, that may be borrowed from said lower priority task, task<sub>r</sub>, is obtained as follows:

70181

$$Nm = Cr \left( 1 - \frac{1}{m} \right)$$

where m is the multiple of the period of said lower priority task, task<sub>r</sub>.

11  
13.

(Original) The method of claim 8, wherein said higher priority task has hard deadlines.

12  
14.

(Original) The method of claim 8, wherein said lower priority task has soft deadlines.

13 15. (Currently Amended) A method for sharing execution capacity among tasks executing in a real-time computing system having a performance specification in accordance with Rate Monotonic Analysis (RMA), comprising the steps of:

pairing a higher priority task, task<sub>u</sub>, with a lower priority task, task<sub>r</sub>;  
reallocating execution time from the lower priority task to the higher priority

task during an overload condition; and

increasing the utilization of said higher priority task; and

decreasing the utilization of said lower priority task in a proportional manner

B/ to maintain a constant utilization, U; and

limiting an amount of execution time, Nr, to borrow from said lower priority task,  
task<sub>r</sub>, to a maximum loan amount where Nr<<Cr, where

Cr = worst-case task execution time of task<sub>r</sub>, and

Nr = amount of execution time to borrow from task<sub>r</sub>.

14 13  
16. (Original) The method of claim 15, wherein said utilizations of said tasks are varied as follows:

$$\frac{Cu}{Tu} + \frac{Cr}{Tr} = U$$

TD 190  
where,

C<sub>u</sub> = worst-case task execution time of task<sub>u</sub>,

T<sub>u</sub> = period of task<sub>u</sub>,

C<sub>r</sub> = worst-case task execution time of task<sub>r</sub>,

T<sub>r</sub> = period of task<sub>r</sub>, and

U = utilization for both tasks.

*B*  
17. (Previously Presented) The method of claim 15, wherein an amount of said execution time available to reallocate from said lower priority task (hereinafter task<sub>r</sub>) to said higher priority task (hereinafter task<sub>u</sub>) is obtained as follows:

*T0200*

$$N_u = \frac{N_r \cdot T_u}{T_r}$$

where,

$N_r$  = amount of execution time to borrow from task<sub>r</sub>, where  $N_r < C_r$ ,

$T_r$  = period of task<sub>r</sub>,

$C_r$  = worst-case task execution time of task<sub>r</sub>, and

$T_u$  = period of task<sub>u</sub>.

*B*  
18. (Original) The method of claim 15, further comprising the step of increasing a period of the lower priority task, task<sub>r</sub>, as follows:

*T0201*

$$T_n = \frac{C_r \cdot T_r}{C_r - N_r}$$

where

$C_r$  = worst-case task execution time of task<sub>r</sub>,

$T_r$  = period of task<sub>r</sub>, and

$N_r$  = amount of execution time to borrow from task<sub>r</sub>, where  $N_r < C_r$ .

*✓* 19. (Cancelled)

*B*  
17 20. (Currently Amended) The method of claim 1519, wherein a maximum execution time,  $N_m$ , that may be borrowed from said lower priority task, task<sub>r</sub>, is obtained as follows:

*T0202*

$$N_m = C_r \left(1 - \frac{1}{m}\right)$$

where  $m$  is the multiple of the period of said lower priority task,  $task_r$ .

*B*  
21.

(Original) The method of claim *15*, wherein said higher priority task has hard deadlines.

*B1*

*B*  
22.

(Original) The method of claim *15*, wherein said lower priority task has soft deadlines.
